

TrigunAI Innovations

Two engines, one company — AI education that ships, and physical-AI research.

NVIDIA Inception Member

Google Android XR Catalyst

WHY NOW

Two pressures, one company built for both

India needs an AI workforce

- The world's #1 AI-learning market — 1.3M+ learners and rising (NASSCOM–Deloitte).
- But the talent pipeline is fragmented and theory-heavy.
- We teach by shipping — learners leave with a published app or a trained policy.

Physical AI is the next decade

- Robotics & embodied AI is where value compounds next.
- India has minimal indigenous capability and little founder-accessible Isaac-grade infra.
- We build that capability in-house on the NVIDIA stack.

Our bet: build the human-capital pipeline for India's physical-AI workforce — and own a piece of the stack while we do it.

THE MODEL

One company, two coupled engines

ENGINE A

Learning Engine

Courses that teach by shipping. Free content → paid live cohort. Run by Deepak. The revenue engine — funds everything.

ENGINE B

Physical AI Engine

Embodied-AI research → IP, course material, and (when funded) hardware products. Avinash leads; Deepak co-leads the drone.

Revenue funds research · Research makes the teaching credible · Both feed talent

Teach by shipping

Recorded videos are free (the funnel). The paid product is a live cohort.

Live courses platform

learn.trigunai.com — magic-link auth, student + admin dashboards. In production.

Flagship course

Build & Ship a VR/MR App — 9 of 11 modules produced and public (EN + HI).

Course lineup

VR/MR (flagship) + Agentic AI + ML & Math, with Physical AI / Robotics in development.

Free funnel

“AI is the Universal Mind” — 7 animated episodes, bilingual, on YouTube.

Proof of shipping

GuruLok — a meditation VR app live on the Meta Quest store.

Simulation-trained intelligence, deployed to the edge

TRACK 1

Drone Cinematography Policy

- PPO trained in NVIDIA Isaac Sim / Isaac Lab (4096 envs, A10G).
- Exported to ONNX (~80 KB), runs on-device at 50 Hz; VR-validated in our Quest app.
- Target hardware: Modal AI Starling 2 + GoPro Hero 12.

TRACK 2

ModusXR — AR Attention Guidance

- Three additive focus modes for optical see-through AR.
- Participant in Google's Android XR Catalyst program.
- Target hardware: XREAL Project Aura; prototyped on Quest 3 passthrough.

THE FLYWHEEL WE'RE BUILDING

Students learn inside the real research

Roadmap thesis — not yet operational

- 1 The Robotics course's labs ARE the real drone-policy pipeline.
- 2 Students learn RL on real NVIDIA hardware — not a toy copy.
- 3 Graduates become collaborators, hires, or customers.
- 4 We sit at the center of India's physical-AI talent flow.

Honest today: the two engines run independently; the robotics course is in development. The coupling is the plan, not a current claim.

NVIDIA TECH

NVIDIA, end to end

Isaac Sim

Isaac Lab

Omniverse

CUDA Toolkit

NVIDIA PyTorch

ONNX → edge

Member of NVIDIA Inception. Policies train on A10G GPUs; edge target is Jetson-class. Not locked in — the ONNX policy ports anywhere.

TRACTION

Where we actually are

Shipped & live

- GuruLok VR app live on the Meta Quest store
- 7 bilingual episodes published (EN + HI)
- Courses platform + 9 VR/MR modules live
- Drone policy trained + VR-validated
- ModusXR in Google Android XR Catalyst
- 5 hostnames in production (Azure, India)

Honest stage

- Pre-revenue. Founding-cohort phase.
- Paid wall opens with the first live cohort.
- ~₹4,000/mo infrastructure. Bootstrapped.
- 2 founders, no outside capital raised.

We show the real stage on purpose — pre-seed, built, and ready to validate willingness-to-pay.

BUSINESS MODEL

Free to understand • paid to transform

One self-run cohort (₹35–49k × ~20) ≈ ₹7–8 L. The moat — provided GPU + VR + “we shipped it” — is uncopiable.

FOUNDERS

Two founders, two engines

Deepak Kumar

CEO · Mumbai

- Runs the Learning Engine; co-leads the drone policy.
- Shipped a Quest app to Meta alpha; built the full video + RL training pipeline.

Avinash

CTO · Patna

- Leads the Physical AI Engine — ModusXR (Android XR Catalyst).
- Deep-learning depth; maintains the shipped Quest apps.

Bootstrapped. NVIDIA Inception member. Google Android XR Catalyst participant.

THE ASK

Seed capital for hardware — operations are self-funded

Drone hardware

Modal AI Starling 2 + GoPro Hero 12 (~\$2.5–3K) + a 6-month flight-test runway.

AR hardware

XREAL Aura developer kits + sustained ModusXR build bandwidth.

The software pipeline is ready. Hardware procurement is the only bottleneck to closing the sim-to-real gap. The Learning Engine funds day-to-day operations.

Let's build the physical-AI workforce.
